[1] SAFETY PRECAUTIONS Before use, read the following safety precautions. This instruction manual explains how to safely use your new DG34a/DG35a MΩ tester. Before use, please read this manual thoroughly. After reading it, keep it together with the product so you can refer to it when necessary.

f this product is not used as specified in this manual, the protection function of this product may be compromised. Instructions given under the "AWARNING" and "ACAUTION" headings must be followed to prevent accidental burns or electrical shock.

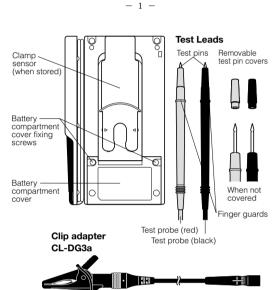

1-1 Explanation of Warning Symbols

- The meanings of the symbols used in this manual and on the
- product are as follows.
- A Very important instruction for safe use The warning messages are intended to prevent accidents to operating personnel such as burn and electrical shock.
- The caution messages are intended to prevent damage to the instrument.
- High-voltage warming. (High voltage is generated from test pins.)
- = : Direct current (DC) .⊥_: Ground ∼ : Alternating current (AC)
 □: Double insulation (Protection Class II)
 LINE/ + - = LINE : Line/Plus input (Red)
- EARTH/ - EARTH : Earth/Minus input (Black)

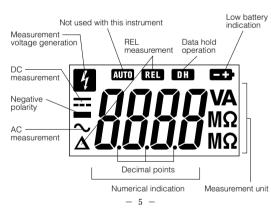

1-2 Warning Instruction for Safe Use

— \land WARNING To ensure that you use the instrument safely, be sure to observe the instructions.

- Never use the instrument on electric circuits that Exceed 3.6 kVA. Pay special attention when measuring voltages of AC 33
- Vrms (46.7 V peak) or DC 70 V or more to avoid injury. The clamp sensor provided with this instrument is
- exclusively for low-voltage use. Perform clamp current measurement with 600 V or less lines. When testing $M\Omega$, disconnect the power supply of the
- device being measured. Since high voltage (500 V/ 250 V/ 125 V) is generated during the testing of $M\Omega$, be careful about electric shock.
- To avoid electric shock, always be sure to discharge the high voltage charged in the measured device after testing $M\Omega$.
- . Never apply an input signal exceeding the maximum rating input value.

3-2 Display

5-3 MΩ Testing

- . Never apply an external voltage on the input terminal.
- 2. Do not turn the function switch during measurement. 3. Do not hold the test probe by a section closer to the test
- pin side behind the finger guard.
- . When the measured object has capacitance, it may remain charged by the applied voltage from this instrument for some time after measurement is completed. Be careful.

Function	Rated voltage range	Max. rating input value	Measurement range	
	125 V			
MΩ (DG34a)	250 V 400.0 ΜΩ		400.0 MΩ	
	500 V			
	125 V			
MΩ (DG35a)	250 V	40.00 MΩ	40.00 MΩ	
	500 V			

- 1) Applications: $M\Omega$ testing of electrical equipment and circuits. 2) Measurement procedure (1) Set the function switch to the desired measurement
- voltage range of $M\Omega$. ② Short-circuit the test pins on the red and black test probes, then press the M Ω START/STOP button to confirm that the test leads are connected (displayed
- value: 3 counts or less). ③ Turn off the power of the device you are going to measure (4) Connect the black test probe (provided, with the
- black clip connected) to the ground line of the device you are going to measure. (5) Connect the red test probe to the other end of the
- line of the device being measured. (6) Press the $M\Omega$ START/STOP button. The testing
- voltage will be applied between the test leads, and $M\Omega$ testing will start. Measurement time is about 30 seconds. Once that time has elapsed, the application of the measurement voltage will stop automatically. Measurement can be stopped at any time by pressing the MO START/STOP button again. The measurement value will be fixed at the value when the button was pressed.

- 9 -

- Never use the instrument when it is not in its case. 1. Always keep your fingers behind the finger guards on the probe and the clamp sensor barrier when taking
- neasurements. 2. Be sure to disconnect the test pins from the circuit when changing the function. 3. Before starting measurement, make sure that the
- function and range are properly set in accordance with the measurement . Never touch the instrument with wet hands or use it in a
- damp environment. 5. When MO is tested, measurement voltage is generated from the black test probe connected to the ground side,
- so do not touch the test pin. 6. When testing M Ω , first connect the black test probe to the ground side of the device being measured and then
- connect the red test probe to the line side. When disconnecting them, first remove the red test probe or the line side and then remove the black test probe on the ground side.
- 7. Never open the instrument case except when replacing batteries. Do not try to alter the original specifications.
- 18. To ensure safety and maintain accuracy, calibrate and check the instrument at least once a year. 19. The instrument is for indoor use only

- \triangle caution

- . When $M\Omega$ is being tested, the measurement terminal of this instrument generates high voltage. It is recommended that devices and parts (such as semiconductors) with low or unknown withstanding voltage be disconnected from the electric wiring (circuit) before it is measured. This is particularly important with computer-related devices.
- 2. When testing M Ω , set the value of the rated voltage as close to the working voltage of the circuit being measured as possible Example: With a 100 V circuit, use a rated voltage of
 - -2 -

[4] DESCRIPTION OF FUNCTIONS

- 🗥 WARNING When canceling an operation, do not turn the function switch during measurement

4-1 Power Switch/Function Switch/Range Switch (All Functions): Turn this switch to turn the power ON and OFF and to select

the measurement function, as well as the rated voltage range of the M Ω test function.

4-2 MΩ START/STOP Button (MΩ Test Function) Each time the START/STOP button is pressed in the M Ω test function, the mode switches in the order of the M Ω testing voltage generation & M Ω testing mode \rightarrow the M Ω testir voltage stop & measurement value data hold mode \rightarrow the M Ω testing voltage generation & M Ω testing mode \rightarrow

In the M Ω testing voltage generation & M Ω testing mode. **M** is illuminated on the display and the selected measurement voltage is generated.

In the $M\Omega$ testing voltage stop & measurement value data hold mode, the measurement voltage is stopped and the measurement value is maintained. "" is illuminated on the display

- The $M\Omega$ testing voltage generation mode automatically stops after about 30 seconds. Should this be the case, the measurement value will not be held. •When the measurement function is switched, the
- measurement value data hold is canceled. 4-3 AC/DC Button (V · CLAMP A Positions)
- Each time this button is pressed in the V or CLAMP A position, the measurement function switches in the order of $AC \rightarrow DC \rightarrow AC \rightarrow \dots$

4-4 REL Button (DCV · ACV · DCA · ACA Functions)

When the DCV, ACV, DCA or ACA function is activated, press this button. "B" and " \bigtriangleup " will be illuminated on the display, and the measurement value will be set using the input value at the time the button was pressed as a reference. To cancel this mode, press the button again and keep it depressed for more than 2 seconds.

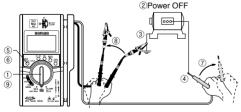

Ex.) Display after the REL button is pressed during DC 100 V input

Actual input value	Display in REL measurement
DC 0120 V	Δ DC 0020 V
DC 0100 V	Δ DC 0000 V
DC 0090 V	Δ DC-0010 V

- 6 -

O To perform the M Ω testing again, press the M Ω START STOP button again.

- (8) After the measurement is complete, release the pin of the red test probe from the device that was measured.
- 9 Release the black test probe from the ground line of the device that was measured. (1) Be sure to set the function switch to the OFF position
- after completing measurement

- ♦ A numerical value appears in the display before the $M\Omega$ START/STOP button is pressed (before the measurement voltage is applied). This is not a malfunction, and the displayed value is irrelevant to
- the measurement. \blacklozenge During M Ω testing, the least significant digit of the displayed measurement value may sometimes flicker. \blacklozenge During M Ω testing, use the rated voltage that's as
- close as possible to the voltage used by the circuit being measured.
- Example: Use the rated voltage of 125 V for an electrical circuit of 100 V.

-10 -

3. When $M\Omega$ is being tested, the built-in batteries will be used up rapidly due to the generation of high voltage. Try to minimize the measurement time.

- . The measurement value may flicker while $M\Omega$ is being tested When the electroluminescent backlight is turned on. built-in batteries will be depleted more rapidly. Use it
- only when it is necessary. Correct measurement may not be possible in areas exposed to strong magnetic fields generated by electrical equipment such as a transformer or large
- current path, electromagnetic waves generated by wireless equipment, or areas where electrostatic charges are generated . This instrument may malfunction or may not be able to
- take correct measurements with special waveforms such as those produced by an inverter circuit.

1-3 Overload Protections

Function	Input terminals	Maximum rating input value	Maximum overload protection input
$DCV \cdot ACV$		DC/AC 600 V	DC/AC 600 V
400 MΩ (DG34a) 40 MΩ (DG35a) 125 V/250 V/500 V	+	Voltage and <u> </u> current input prohibited	250 V AC (50/60 Hz) 30 sec.
DCA · ACA	Clamp sensor section	DC/AC 100 A	100 A DC/AC

Note: AC voltage and AC current are regulated by rms, values of sinusoidal wave.

[2] APPLICATION AND FEATURES

2-1 Applications Integrating the measurement functions demanded at electrical work sites, including M Ω testing, DC/AC clamp current measurement and DC/AC voltage measurement into a single unit, this instrument is a compact MΩ tester with clamp sensor ideal for electrical work.

Notes

 This operation cannot be used with the MΩ test function • When the function is switched, the REL measurement will be canceled.

4-5 BACKLIGHT Button (All Functions)

Press this button to turn on the backlight. The backlight will automatically turn off after about 10 seconds

4-6 DATA HOLD Button (DCV · ACV · DCA · ACA Functions) When this button is pressed, ". will be illuminated on the display and the measurement value displayed at that time will be maintained. Pressing this button again will cancel the DATA HOLD mode and restore the measurement mode Note: This operation cannot be used with the $M\Omega$ test function.

4-7 Low Battery Indication (All Functions)

When the built-in batteries are exhausted and the battery voltage drops below about 2.6 V. 📼 will appear in the display. If this icon is lit, replace the batteries with new ones (two at the same time).

[5] MEASUREMENT PROCEDURE

5-1 Start-Up Inspection

- 🗥 WARNING
- I. Make sure that the low battery indication does not appear in the display.
- . Never use the instrument if the instrument or test leads
- are damaged or broken 3. Check continuity of test leads.

Note: If there is no display, the batteries may be exhausted.

- \land WARNING 1. This section is very important for safety. Read and understand the following instructions fully and maintain

your instrument properly. The instrument must be calibrated and inspected at least once a year to maintain its safety and accuracy.

6-1 Maintenance and Inspection

1) Appearance Has the appearance been damaged by falling?

 Is the test lead cord damaged? Is the core wire exposed at any place on the test

If the built-in fuse is blown, current measurement is impossible. Make sure that the test leads are not cut, referring to the section 5-1.

The manufacturer may conduct calibration and inspection. For more information, please contact your dealer.

6-3 Battery Replacement

— \land WARNING . To avoid electric shock, do not remove the battery compartment cover when input is applied to the measurement terminal and clamp sensor or when measurement is being performed.

2. Be sure to confirm that the function switch is set to "OFF" before replacing the batteries

Set the batteries with their polarities facing in the correct
