

OPAx180 0.1- $\mu\text{V}/^\circ\text{C}$ Drift, Low-Noise, Rail-to-Rail Output, 36-V, Zero-Drift Operational Amplifiers

1 Features

- Low Offset Voltage: 75 μV (Maximum)
- Zero-Drift: 0.1 $\mu\text{V}/^\circ\text{C}$
- Low Noise: 10 $\text{nV}/\sqrt{\text{Hz}}$
- Very Low 1/f Noise
- Excellent DC Precision:
 - PSRR: 126 dB
 - CMRR: 114 dB
 - Open-Loop Gain (A_{OL}): 120 dB
- Quiescent Current: 525 μA (Maximum)
- Wide Supply Range: $\pm 2\text{ V}$ to $\pm 18\text{ V}$
- Rail-to-Rail Output:
Input Includes Negative Rail
- Low Bias Current: 250 pA (Typical)
- RFI Filtered Inputs
- *MicroSIZE* Packages

2 Applications

- Bridge Amplifiers
- Strain Gauges
- Test Equipment
- Transducer Applications
- Temperature Measurement
- Electronic Scales
- Medical Instrumentation
- Resistor Thermal Detectors
- Precision Active Filters

3 Description

The OPA180, OPA2180 and OPA4180 operational amplifiers (op amps) use TI's proprietary **zero-drift** techniques to simultaneously provide low offset voltage (75 μV), and near zero-drift over time and temperature. These miniature, high-precision, low-quiescent-current op amps offer high input impedance and rail-to-rail output swing within 18 mV of the rails. The input common-mode range includes the negative rail. Single- or dual-supplies ranging from 4 V to 36 V ($\pm 2\text{ V}$ to $\pm 18\text{ V}$) can be used.

The dual-channel version is offered in VSSOP-8 packages and SOIC-8 packages. The quad-channel version is offered in SOIC-14 and TSSOP-14 packages. The single and quad package offerings (OPA180 and OPA4180) are specified from -40°C to $+125^\circ\text{C}$, and the dual package (OPA2180) is specified from -40°C to $+105^\circ\text{C}$.

Device Information⁽¹⁾

| DEVICE NAME | PACKAGE | BODY SIZE (NOM) |
|-------------|-----------------|-------------------|
| OPA180 | SOT-23 (5) | 1.60 mm x 2.90 mm |
| | VSSOP, MSOP (8) | 3.00 mm x 3.00 mm |
| | SOIC (8) | 4.90 mm x 3.91 mm |
| OPA2180 | VSSOP, MSOP (8) | 3.00 mm x 3.00 mm |
| | SOIC (8) | 4.90 mm x 3.91 mm |
| OPA4180 | TSSOP (14) | 5.00 mm x 4.40 mm |
| | SOIC (14) | 8.65 mm x 3.91 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Low Noise
(Peak-to-Peak Noise = 250 nV)

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision D (May 2014) to Revision E | Page |
|--|-------------|
| • Changed OPA180 and OPA4180 operating temperature from "–40°C to +105°C" to "–40°C to +125°C" in <i>Description</i> section | 1 |
| • Added storage temperature parameter as the last row in the <i>Absolute Maximum Ratings</i> table | 8 |
| • Changed maximum operating temperature value from 105°C to 125°C in <i>Absolute Maximum Ratings</i> table | 8 |
| • Changed maximum operating temperature value from 105°C to 125°C in <i>Recommended Operating Conditions</i> table | 8 |
| • Changed input offset voltage drift temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Changed power supply rejection ratio temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Changed OPA180 input bias current temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Added minimum OPA2180 input bias current value of 18 nA in <i>Electrical Characteristics</i> table | 10 |
| • Added minimum OPA180 input bias current value of 18 nA in <i>Electrical Characteristics</i> table | 10 |
| • Changed OPA180 input offset current temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Added minimum OPA2180 input offset current value of 6 nA in <i>Electrical Characteristics</i> table | 10 |
| • Added minimum OPA180 input offset current value of 6 nA in <i>Electrical Characteristics</i> table | 10 |
| • Changed common-mode rejection ratio temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Changed open-loop voltage gain temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 10 |
| • Changed voltage output swing from rail temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 11 |
| • Changed quiescent current temperature range from $T_A = -40^\circ\text{C to } 105^\circ\text{C}$ to $T_A = -40^\circ\text{C to } +125^\circ\text{C}$ in <i>Electrical Characteristics</i> table | 11 |
| • Changed operating temperature from "–40°C to +105°C" to "–40°C to +125°C" in <i>Feature Description</i> section | 18 |
| • Updated Figure 34 | 24 |

Revision History (continued)

- Changed operating temperature from "–40°C to +105°C" to "–40°C to +125°C" in *Power Supply Recommendations* section 25

Changes from Revision C (December 2012) to Revision D **Page**

- Changed format to meet latest data sheet standards; added *Device Functional Modes, Application and Implementation*, and *Power Supply Recommendations* sections, and moved existing sections 1
- Added OPA180 to document..... 1
- Added Device Information table 1
- Deleted Package Information table 5
- OPA180 pinout drawings 5
- Added Pin Functions table 5
- Added Pin Functions table 6
- Added Pin Functions table 7
- Added Recommended Operating Conditions table 8
- Added Thermal Information: OPA180 table..... 9
- Changed Offset Voltage, *Long-term stability* parameter typical specification in Electrical Characteristics table..... 10
- Changed last sentence of *EMI Rejection* section..... 18

Changes from Revision B (December 2011) to Revision C **Page**

- Changed product status from Mixed Status to Production Data 1
- Changed OPA4180 status to Production Data..... 1
- Added package marking to OPA2180 VSSOP-8 row in Package Information table..... 5
- Deleted ordering number and transport media columns from Package Information table..... 5
- Changed Input Bias Current section in Electrical Characteristics ($V_S = +4\text{ V to }+36\text{ V}$) table 10

Changes from Revision A (November 2011) to Revision B **Page**

- Changed footnote 1 of Electrical Characteristics table..... 10
- Updated [Figure 7](#) 13

5 Device Comparison Table

Table 1. Zero-Drift Amplifier Portfolio

| VERSION | PRODUCT | OFFSET VOLTAGE (μV) | OFFSET VOLTAGE DRIFT ($\mu\text{V}/^\circ\text{C}$) | BANDWIDTH (MHz) |
|---------|---------------------------------------|-------------------------------------|--|--------------------|
| Single | OPA188 (4 V to 36 V) | 25 | 0.085 | 2 |
| | OPA180 (4 V to 36 V) | 75 | 0.35 | 2 |
| | OPA333 (5 V) | 10 | 0.05 | 0.35 |
| | OPA378 (5 V) | 50 | 0.25 | 0.9 |
| | OPA735 (12 V) | 5 | 0.05 | 1.6 |
| Dual | OPA2188 (4 V to 36 V) | 25 | 0.085 | 2 |
| | OPA2180 (4 V to 36 V) | 75 | 0.35 | 2 |
| | OPA2333 (5 V) | 10 | 0.05 | 0.35 |
| | OPA2378 (5 V) | 50 | 0.25 | 0.9 |
| | OPA2735 (12 V) | 5 | 0.05 | 1.6 |
| Quad | OPA4188 (4 V to 36 V) | 25 | 0.085 | 2 |
| | OPA4180 (4 V to 36 V) | 75 | 0.35 | 2 |
| | OPA4330 (5 V) | 50 | 0.25 | 0.35 |

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

| | | MIN | MAX | UNIT |
|------------------|-------------------------------------|------------|-----------------------------|------|
| | Supply voltage | | ±20, ±40 (single-supply) | V |
| | Signal input terminals | Voltage | (V-) - 0.5 (V+) + 0.5 | V |
| | | Current | ±10 | mA |
| | Output short-circuit ⁽²⁾ | Continuous | | |
| | Operating temperature | -55 | 125 | °C |
| T _J | Junction temperature | | 150 | °C |
| T _{stg} | Storage temperature | -65 | 150 | °C |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Short-circuit to ground, one amplifier per package.

7.2 ESD Ratings

| | | MIN | MAX | UNIT | |
|--------------------|---------------------------|--|------|------|----|
| T _{stg} | Storage temperature range | -65 | 150 | °C | |
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾ | -1.5 | 1.5 | kV |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | -1 | 1 | |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted), R_L = 10 kΩ connected to V_S / 2, and V_{COM} = V_{OUT} = V_S / 2, (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|------------------------------|----------------|-------|-----|-----|------|
| Supply voltage [(V+) - (V-)] | Single-supply | 4.5 | | 36 | V |
| | Bipolar-supply | ±2.25 | | ±18 | V |
| Operating temperature | | -40 | | 125 | °C |

7.4 Thermal Information: OPA180

| THERMAL METRIC ⁽¹⁾ | | OPA180 | | | UNIT |
|-------------------------------|--|----------|--------------|------------|------|
| | | D (SOIC) | DBV (SOT-23) | DGK (MSOP) | |
| | | 8 PINS | 5 PINS | 8 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 115.8 | 158.8 | 180.4 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case(top) thermal resistance | 60.1 | 60.7 | 67.9 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 56.4 | 44.8 | 102.1 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 12.8 | 1.6 | 10.4 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 55.9 | 4.2 | 100.3 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case(bottom) thermal resistance | N/A | N/A | N/A | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Thermal Information: OPA2180

| THERMAL METRIC ⁽¹⁾ | | OPA2180 | | UNIT |
|-------------------------------|--|----------|------------|------|
| | | D (SOIC) | DGK (MSOP) | |
| | | 8 PINS | 8 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 111 | 159.3 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 54.9 | 37.4 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 51.7 | 48.5 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 9.3 | 1.2 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 51.1 | 77.1 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | N/A | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.6 Thermal Information: OPA4180

| THERMAL METRIC ⁽¹⁾ | | OPA4180 | | UNIT |
|-------------------------------|--|----------|------------|------|
| | | D (SOIC) | PW (TSSOP) | |
| | | 14 PINS | 14 PINS | |
| $R_{\theta JA}$ | Junction-to-ambient thermal resistance | 93.2 | 106.9 | °C/W |
| $R_{\theta JC(top)}$ | Junction-to-case (top) thermal resistance | 51.8 | 24.4 | °C/W |
| $R_{\theta JB}$ | Junction-to-board thermal resistance | 49.4 | 59.3 | °C/W |
| Ψ_{JT} | Junction-to-top characterization parameter | 13.5 | 0.6 | °C/W |
| Ψ_{JB} | Junction-to-board characterization parameter | 42.2 | 54.3 | °C/W |
| $R_{\theta JC(bot)}$ | Junction-to-case (bottom) thermal resistance | N/A | N/A | °C/W |

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.7 Electrical Characteristics: $V_S = \pm 2\text{ V to } \pm 18\text{ V}$ ($V_S = 4\text{ V to } 36\text{ V}$)

 at $T_A = 25^\circ\text{C}$, $R_L = 10\text{ k}\Omega$ connected to $V_S / 2$, and $V_{\text{COM}} = V_{\text{OUT}} = V_S / 2$, unless otherwise noted.

| PARAMETER | | CONDITIONS | MIN | TYP | MAX | UNIT |

8 Detailed Description

8.1 Overview

The OPAx180 family of operational amplifiers combine precision offset and drift with excellent overall performance, making them designed for many precision applications. The precision offset drift of only $0.1 \mu\text{V}/^\circ\text{C}$ provides stability over the entire temperature range. In addition, the devices offer excellent overall performance with high CMRR, PSRR, and A_{OL} . As with all amplifiers, applications with noisy or high-impedance power supplies require decoupling capacitors close to the device pins. In most cases, $0.1\text{-}\mu\text{F}$ capacitors are adequate.

8.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Operating Characteristics

The OPAx180 family of amplifiers is specified for operation from 4 V to 36 V (± 2 V to ± 18 V). Many of the specifications apply from -40°C to $+125^{\circ}\text{C}$. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Typical Characteristics](#).

8.3.2 EMI Rejection

The OPAx180 family uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI interference from sources such as wireless communications and densely populated boards with a mix of analog signal chain and digital components. EMI immunity can improve with circuit design techniques; the OPAx180 family benefits from these design improvements. Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. [Figure 25](#) shows the results of this testing on the OPAx180 family. For more detailed information, see the [EMI Rejection Ratio of Operational Amplifiers](#) application report, available for download from www.ti.com.

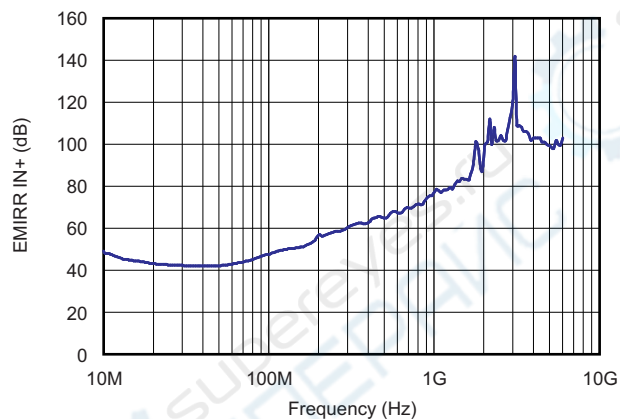

Figure 25. OPAx180 EMIRR Testing

8.3.3 Phase-Reversal Protection

The OPAx180 family has an internal phase-reversal protection. Many op amps exhibit a phase reversal when the input is driven beyond the linear common-mode range. This condition is most often encountered in noninverting circuits when the input is driven beyond the specified common-mode voltage range, causing the output to reverse into the opposite rail. The input of the OPAx180 prevents phase reversal with excessive common-mode voltage. Instead, the output limits into the appropriate rail. This performance is shown in [Figure 26](#).

Figure 26. No Phase Reversal

Feature Description (continued)

8.3.4 Capacitive Load and Stability

The dynamic characteristics of the OPAx180 are optimized for a range of common operating conditions. The combination of low closed-loop gain and high capacitive loads decreases the phase margin of the amplifier and can lead to gain peaking or oscillations. As a result, heavier capacitive loads must be isolated from the output. The simplest way to achieve this isolation is to add a small resistor (for example, R_{OUT} equal to $50\ \Omega$) in series with the output. Figure 27 and Figure 28 illustrate graphs of small-signal overshoot versus capacitive load for several values of R_{OUT} . See the [Feedback Plots Define Op Amp AC Performance](#), application report, available for download from the TI website, for details of analysis techniques and application circuits.

8.3.5 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but may involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

These ESD protection diodes also provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA as stated in the [Absolute Maximum Ratings](#) table. Figure 29 shows how a series input resistor may be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

Figure 29. Input Current Protection

An ESD event produces a short duration, high-voltage pulse that is transformed into a short duration, high-current pulse as the pulse discharges through a semiconductor device. The ESD protection circuits are designed to provide a current path around the operational amplifier core to protect the core from damage. The energy absorbed by the protection circuitry is then dissipated as heat.

Feature Description (continued)

When the operational amplifier connects into a circuit, the ESD protection components are intended to remain inactive and not become involved in the application circuit operation. However, circumstances may arise when an applied voltage exceeds the operating voltage range of a given pin. If this condition occurs, there is a risk that some of the internal ESD protection circuits may be biased on, and conduct current. Any such current flow occurs through ESD cells and rarely involves the absorption device.

If there is an uncertainty about the ability of the supply to absorb this current, external zener diodes may be added to the supply pins. The zener voltage must be selected so the diode does not turn on during normal operation.

However, the zener voltage must be low enough so that the zener diode conducts if the supply pin begins to rise above the safe operating supply voltage level.

8.4 Device Functional Modes

The OPAx180, OPA2180, and OPA4180 devices are powered on when the supply is connected. These devices can operate as a single-supply operational amplifier or dual-supply amplifier depending on the application. In single-supply operation with V_- at ground (0 V), V_+ can be any value between 4 V and 36 V. In dual-supply operation, the supply voltage difference between V_- and V_+ is from 4 V to 36 V. Typical examples of dual-supply configuration are ± 5 V, ± 10 V, ± 15 V, and ± 18 V. However, the supplies must not be symmetrical. Less common examples are V_- at -3 V and V_+ at 9 V, or V_- at -16 V and V_+ at 5 V. Any combination where the difference between V_- and V_+ is at least 4 V and no greater than 36 V is within the normal operating capabilities of these devices.

9 Application and Implementation

9.1 Application Information

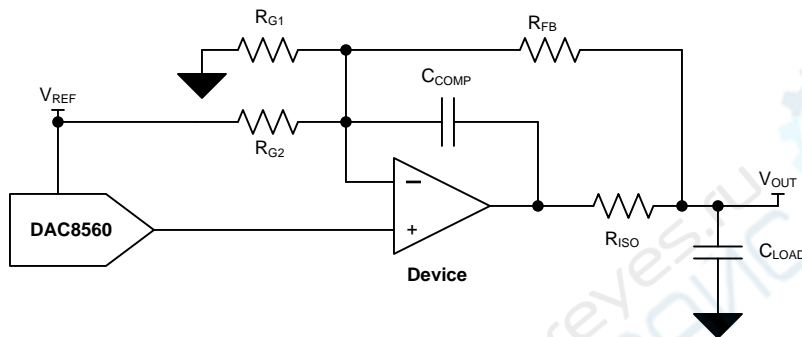

The OPAx180 family offers excellent DC precision and AC performance. These devices operate up to 36-V supply rails and offer rail-to-rail output, ultra-low offset voltage, offset voltage drift and 2-MHz bandwidth. These features make the OPAx180 a robust, high-performance amplifier for high-voltage industrial applications.

9.2 Typical Applications

These application examples highlight a few of the circuits where the OPAx180 family can be used.

9.2.1 Bipolar ± 10 -V Analog Output from a Unipolar Voltage Output DAC

This design is used for conditioning a unipolar digital-to-analog converter (DAC) into an accurate bipolar signal source using the OPAx180 family and three resistors. The circuit is designed with reactive load stability in mind, and is compensated to drive nearly any conventional capacitive load associated with long cable lengths.

Figure 30. Circuit Schematic

9.2.1.1 Design Requirements

The design requirements are as follows:

- DAC supply voltage: +5-V dc
- Amplifier supply voltage: ± 15 -V dc
- Input: 3-wire, 24-bit SPI
- Output: ± 10 -V dc

Typical Applications (continued)

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Component Selection

DAC: For convenience, devices with an external reference option or devices with accessible internal references are desirable in this application because the reference creates an offset. The DAC selection in this design must primarily be based on DC error contributions typically described by offset error, gain error, and integral nonlinearity error. Occasionally, additional specifications are provided that summarize end-point errors of the DAC typically called zero-code and full-scale errors. For AC applications, slew rate and settling time may require additional consideration.

Amplifier: Amplifier input offset voltage (V_{IO}) is a key consideration for this design. V_{IO} of an operational amplifier is a typical data sheet specification, but in-circuit performance is also affected by drift over temperature, the common-mode rejection ratio (CMRR), and power-supply rejection ratio (PSRR); thus consideration should be given to these parameters as well. For ac operation, additional considerations should be made concerning slew rate and settling time. Input bias current (I_B) can also be a factor, but typically the resistor network is implemented with sufficiently small resistor values that the effects of input bias current are negligible.

Passive: Resistor matching for the op-amp resistor network is critical for the success of this design; components with tight tolerances must be selected. For this design, 0.1% resistor values are implemented, but this constraint may be adjusted based on application-specific design goals. Resistor matching contributes to offset error and gain error in this design; see [Bipolar \$\pm 10V\$ Analog Output from a Unipolar Voltage Output DAC](#) for further details. The tolerance of the R_{ISO} and C_{COMP} stability components is not critical, and 1% components are acceptable.

9.2.1.3 Application Curves

9.2.2 Discrete INA + Attenuation

The OPAx180 family can be used as a high-voltage, high-impedance front-end for a precision, discrete instrumentation amplifier with attenuation. The INA159 in Figure 33 provides the attenuation that allows this circuit to simply interface with 3.3-V or 5-V analog-to-digital converters (ADCs).

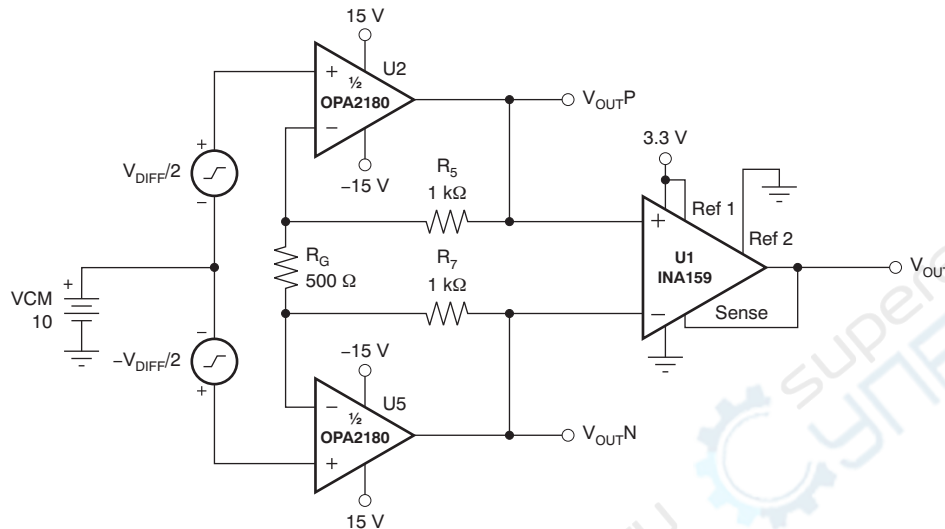

Figure 33. Discrete INA + Attenuation for ADC With a 3.3-V Supply

9.2.3 RTD Amplifier

The OPAx180 is excellent for use in analog linearization of resistance temperature detectors (RTDs). The circuit below (Figure 34) combines the precision of the OPAx180 amplifier and the precision reference of the REF5050 to linearize a Pt100 RTD.

Figure 34. RTD Amplifier with Linearization

10 Power Supply Recommendations

The OPAx180 family is specified for operation from 4 V to 36 V (± 2 V to ± 18 V); many specifications apply from -40°C to $+125^{\circ}\text{C}$. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in [Layout](#)

CAUTION

Supply voltages larger than 40 V can permanently damage the device; see the [Absolute Maximum Ratings](#).

Place 0.1- μF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see [Layout](#).

11 Layout

11.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and op amp itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
 - Connect low-ESR, 0.1- μ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are typically devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- In order to reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If it is not possible to keep the input traces separate, it is much better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. As shown in Figure 35, keeping RF and RG close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.

EXAMPLE BOARD LAYOUT

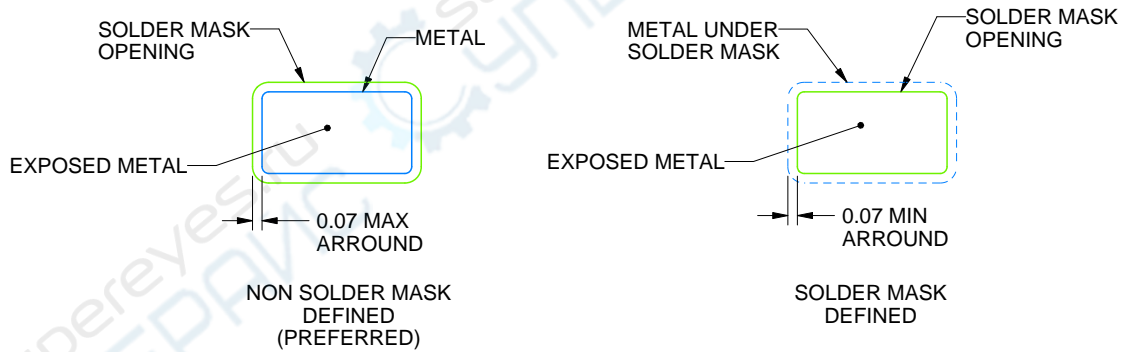

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/G 03/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/G 03/2023

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

D (R-PDSO-G14)

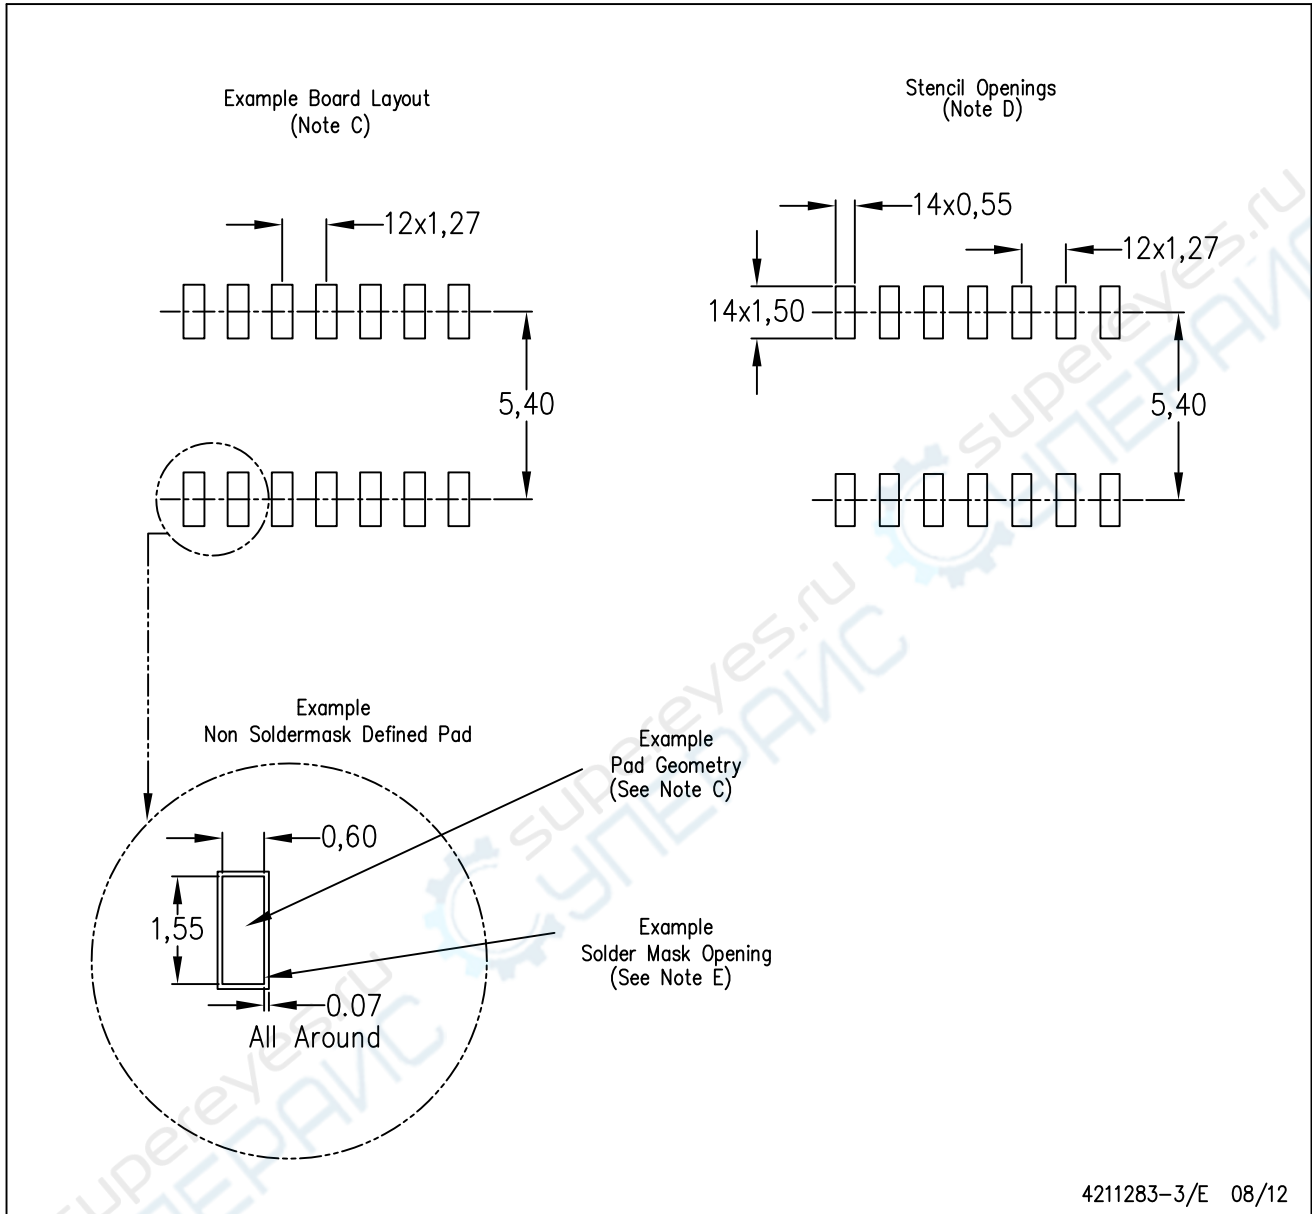

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 -  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
 -  Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
 - E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

PLASTIC SMALL OUTLINE

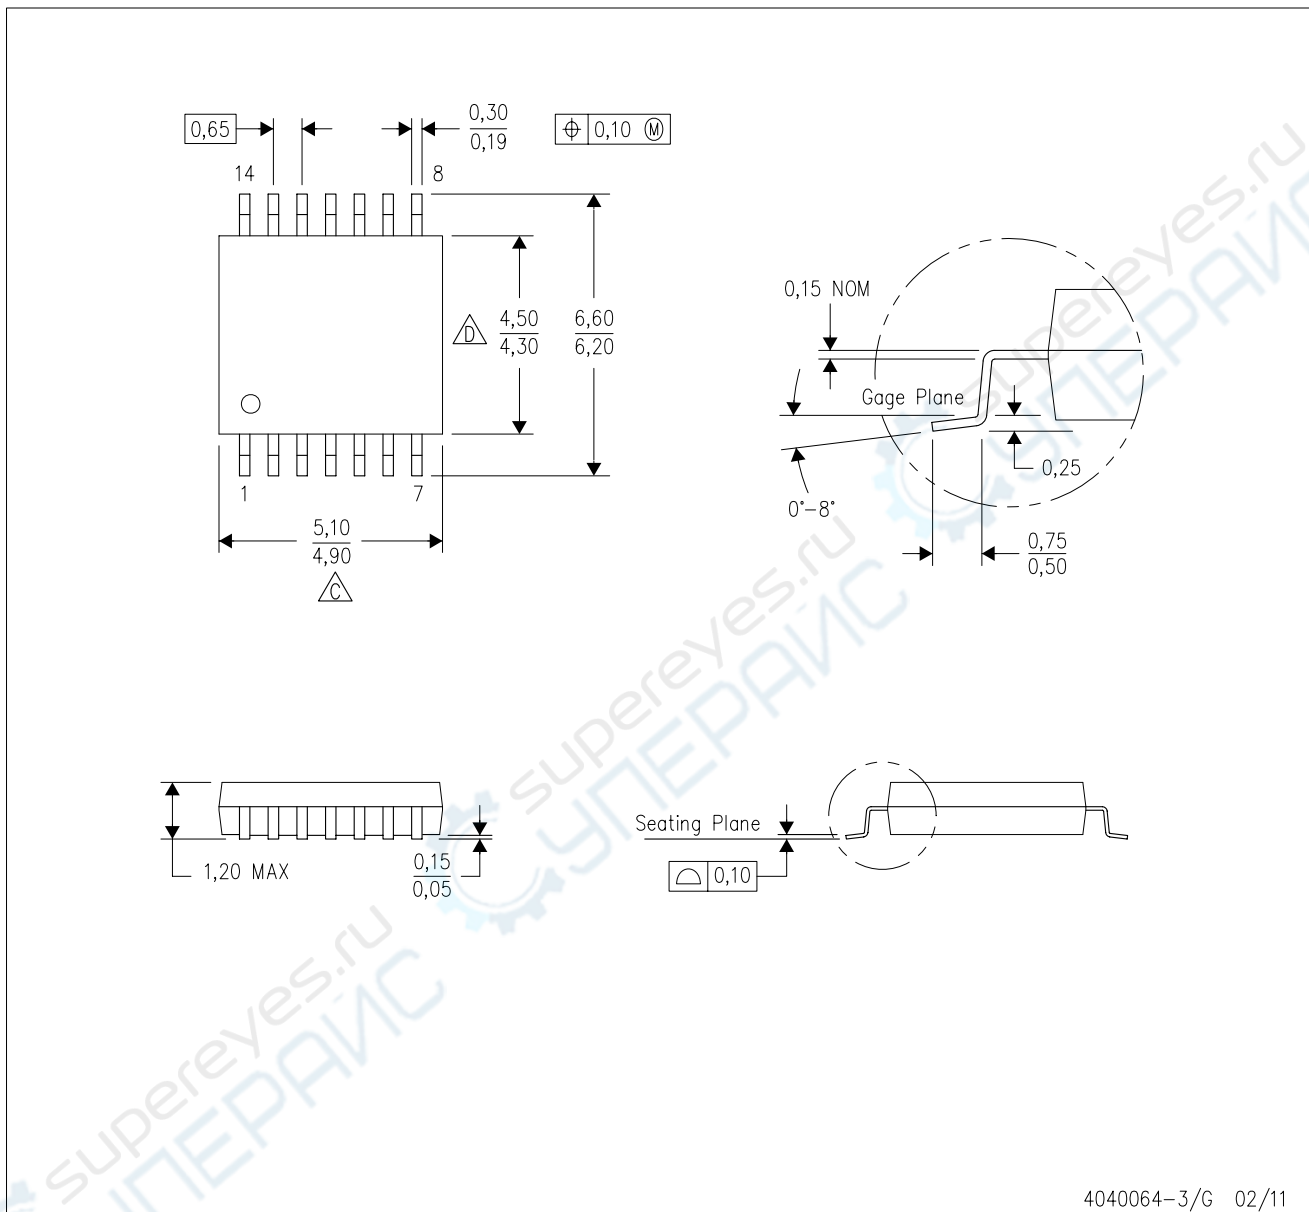

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

MECHANICAL DATA

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
 - E. Falls within JEDEC MO-153

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4211284-2/G 08/15

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D0008A

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

EXAMPLE BOARD LAYOUT

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

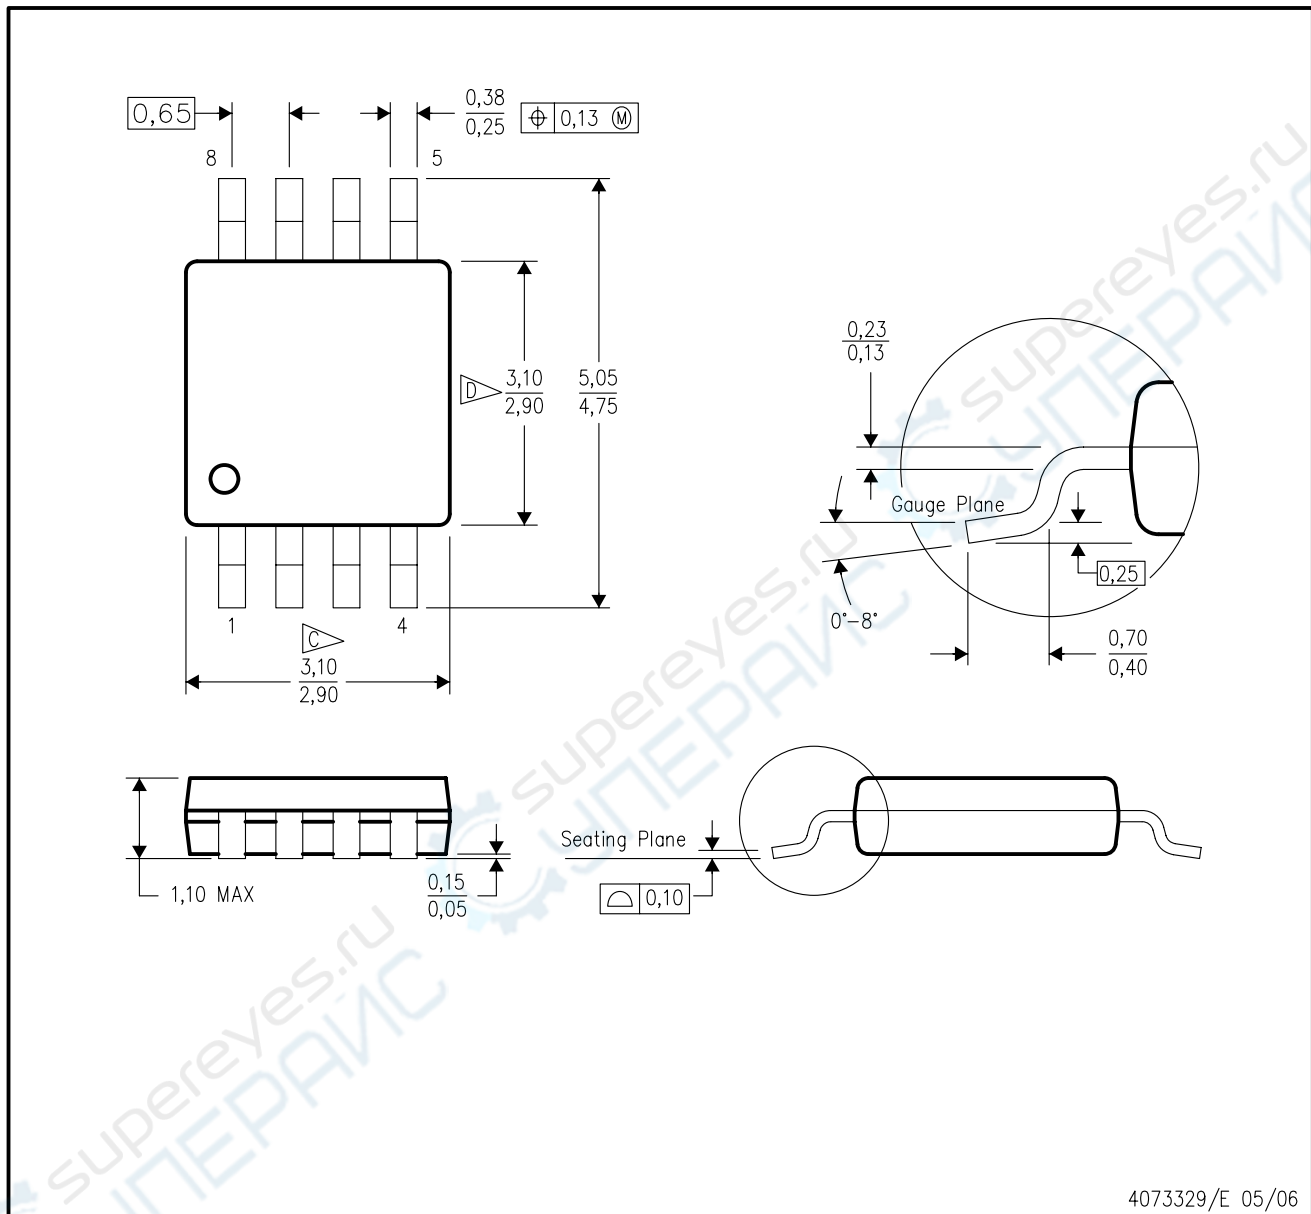

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
